1 Product introduction

JMY501C is RFID read/write module with an UART and IIC serial port. JMY501C has various functions and supports multi ISO/IEC standard of contactless card. The RF protocol is complex. The designer combined some frequent used command of RF card and then user could operate the cards with full function by sending simple command to the module.

The impedance between RF module and antenna was tuned by impedance analyzer. And then the module has excellent performance and stability.

The module and antenna is split design. 4 wires are linked the antenna and module. Normally the wire should be less than 200mm, or it will affect the module's performance and stability.

2 Characteristics

- PCD model: NXP MF RC531
- Working frequency: 13.56MHz
- Supported standard: ISO14443A, ISO14443B
- Card supported: Mifare 1K/4K, FM11RF08, Ultra Light, DesFire, Mifare ProX, SR176, SRI512, SRI1K, SRI2K, SRI4K, SRIX4K, T=CL smart cards(both ISO14443A & ISO14443B)
- Anti collision ability: Full function anti collision; be able to process multi-cards; be able to set operate single card only
- Auto detecting card: Supported, default OFF
- EEPROM: 512 Bytes
- Power supply: DC 5V ($\pm 0.5V$)
- Interface: IIC & UART (selected by SPS pin, recommend to use IIC)
- Communication rate: IIC: 400Kbps
UART: 19.2Kbps/115.2Kbps
- Max. command length: 254 Bytes
- Interface level: 3.3V (TTL level; 5V tolerance)
- Power consumption: 70mA
- Operating distance: 100mm (depending on card and antenna design)
- Dimension: 21mm * 42mm
- Package: DIP32
- Weight: About 15g
- ISP: Supported
- Operating temperature: -25 to +85 °C
- Storage temperature: -40 to +125 °C
- RoHS: Compliant

3 Physical parameter and pin outs

3.1 Photo

3.2 Dimension

3.3 Pin Configurations and pin outs

| PIN | Function | Type | Description |
|-----|----------|--------------|---|
| 1 | RX | RF Analog | Antenna receive |
| 2 | TGND | RF Analog | Antenna GND |
| 13 | RE | Output | RE/DE 485 directional control output |
| 14 | ICC | Output | Card in/out indication 0: card in; 1: card out |
| 15 | TXD/SDA | Input/output | UART TXD/IIC SDA |
| 16 | RXD/SCL | Input | UART RXD/IIC SCL |
| 17 | VCC | Power | VCC |
| 18 | GND | Power | GND |
| 19 | SPS | Input | Serial port selector 0: IIC 1: UART |
| 31 | TX1 | RF Analog | Antenna output 1 |
| 32 | TX2 | RF Analog | Antenna output 2 |

3.4 Antennas

Normally, as the size of TX50x may not meet the actual demands, the antenna needs to be customized, especially in some compact systems. The following information for customization is needed: 1. Dimension of the antenna PCB; 2. the position and direction of the antenna outlet and the connector; 3. the description of the antenna periphery. Jinmuyu will design the most proper antenna according to the user's exact requirements.

We provide many models of antenna. Please visit our website to get more information. There are some recommended models in the table:

| Antenna model | Size of antenna | Card operating distance |
|---------------|-----------------|-------------------------|
| TX500-2 | 70mm * 70mm | 90mm |
| TX501-2 | 50mm * 50mm | 70mm |
| TX502-2 | 30mm * 30mm | 60mm |

3.5 Connection schematics

3.6 JMY500 testing board

JMY500 testing board is a tool designed for testing of JMY50x series module, it could test the module completely with several steps. JMY500 operate the module via MCS51 MCU and it could to change the communication port (IIC or UART) of module. According to our source program (include IIC and UART), user is able to finish the program of application system.

JMY500 is also communicating with PC through RS232 port. Then user programs the testing software and completes the test to the module.

3.7 Model rule

3.7.1 Model format

| | | |
|-----|-----|---|
| 1 | 2 | 3 |
| JMY | 501 | X |

1: company code; 2: product series code; 3: card operating type

3.7.2 Card operating type

M: PCD is RC500, support Mifare Class

A: PCD is RC500, support ISO14443A and Mifare Class

C: PCD is RC531, support ISO14443A, ISO14443B and Mifare Class

G: PCD is RC400, support ISO15693

H: PCD is RC632, support ISO15693, ISO14443A, ISO14443B and Mifare Class

D: PCD is RC500, support ISO14443A and Mifare Class with 511 bytes communication buffer

E: PCD is RC531, support ISO14443AB and Mifare Class with 511 bytes communication buffer

4 Communication protocols

4.1 Overview

The module has IIC and UART interfaces. We recommend using IIC interface whose communication rate is up to 400Kbps (normal rate is 100Kbps). But the baud rate of UART is 19.2Kbps and 115.2Kbps. We supply sample source code in C and ASM of MCS51 of the interface program both in IIC and UART. IIC mode is very convenient, user no need to modify the sample code except pin definition in actual using.

Whatever what type of interface user chooses. Please read this chapter before programming and refer to the sample program. There are detailed comments in the sample source code.

4.2 UART protocol

4.2.1 Parameters

The communication protocol is byte oriented. Both sending and receiving bytes are in hexadecimal format. The communication parameters are as follows:

- Baud rate: 19200bps(default), 115200bps
- Data bits: 8 bits
- Stop bits: 1 bit
- Parity check: None
- Flow control: None

4.2.2 Data send format

| Header | Length | Command | Data | Checksum |
|--------|--------|---------|------|----------|
|--------|--------|---------|------|----------|

- Header: 2 bytes, they are 0xAA 0xBB
- Length: 1 byte, number of bytes from Command length byte to the last byte of Data
- Command: 1 byte, the command of this instruction
- Data: length depends on the command type, length from 0 to 251 bytes
- Checksum: 1 byte, Exclusive OR (XOR) results from length byte to the last byte of data
- **If there is 0xAA in data package, and then MUST insert 0x00 follow to distinguish with header. But Length byte in the package does NOT increase**

4.2.3 Data return format

- Success:

| Header | Length | Command | Data | Checksum |
|--------|--------|---------|------|----------|
|--------|--------|---------|------|----------|

- Failure:

| | | | |
|--------|--------|----------------|----------|
| Header | Length | Invert Command | Checksum |
|--------|--------|----------------|----------|

4.3 IIC protocol

4.3.1 Module IIC address and multi device communications

IIC bus is able to connect with 128 devices. The IIC address of module is default 0xA0. Users change the address setting via sending the command (0x19), so that user could connect multi modules on the same IIC bus.

4.3.2 IIC device operation

4.3.2.1 Clock and data transaction

The SDA pin is normally pulled high with an external device. Data on the SDA pin may change only during SCL low time periods. Data changes during SCL high periods will indicate a start or stop condition as defined below.

4.3.2.2 Start condition

A high-to-low transition of SDA with SCL high is a start condition, which must precede any other command.

4.3.2.3 Stop condition

A low-to-high transition of SDA with SCL high is a stop condition.

4.3.2.4 Acknowledge (ACK)

All addresses and data words are serially transmitted to and from the module in 8-bit words. The module sends a zero to acknowledge that it is not busy and has received each word. This happens during the ninth clock cycle.

4.3.2.5 Bus state

When the module has received command, and then doesn't acknowledge IIC bus until ends with the card communication.

4.3.2.6 Device addressing

The module requires a 7-bit device address following a start condition to enable the chip for a read or write operation.

The device address word consists of 7 addressing bits and 1 operation select bit.

The first 7 bits of the module address are 1010000 (0xA0 in hex)

The eighth bit of the device address is the read/write operation select bit. A read operation is initiated if this bit is high and a write operation is initiated if this bit is low.

The first byte after the START procedure.

4.3.2.7 Write operation

The host device sends a command to module via write operation.

4.3.2.8 Read Operation

The host device gets result via read operation.

4.3.3 Data transaction

The module is a slave device of the IIC bus, then the host need to write the command package to module. The module will execute the command. Then the host needs to poll the status of the module while it is working by sending out the command of “read” continuously. If the module answered to a read operation, then the last command execution were finished. At this time the host could read the result and/or data from the module. The read and write operation see chapter 4.3.2.7 and 4.3.2.8.

4.3.4 Format of data package

| | | | |
|--------|---------|------|----------|
| Length | Command | Data | Checksum |
|--------|---------|------|----------|

- Length: 1 byte, number of bytes from length to the last byte of Data
- Command: 1byte, the command of this instruction
- Data: Data length depending on the command type, length from 0 to 251 bytes
- Checksum: 1 byte, Exclusive OR (XOR) results from Length byte to the last byte of data

4.3.5 Data return format of IIC

- Success:

| | | | |
|--------|---------|------|----------|
| Length | Command | Data | Checksum |
|--------|---------|------|----------|

- Failure:

| | | |
|--------|----------------|----------|
| Length | Invert Command | Checksum |
|--------|----------------|----------|

4.3.6 Description of IIC command transaction

E.g.: to read the block 1 of Mifare card, the steps:

Send command: 0A210001FFFFFFFFFFFF2A

There are steps here:

- A. Write command to module
 1. Start condition
 2. Send control byte, it is 0xA0, the meaning is: address 0xA0 + write control 0x00
 3. Send module command: 0x0A210001FFFFFFFFFFFF
 4. Send command checksum: 0x2A
 5. Stop condition
- B. Send IIC read command. If module no ACK, then the module is working. Repeat this step.
 1. Start condition
 2. Send control byte 0xA1, it is IIC slave address 0xA0 + read control 0x01
 3. If module is no ACK, go to step B. if yes, go to step C
- C. Get the data bytes from module
 1. Get the first byte and send ACK, if the data is 0x12, the meaning is there are 18 bytes useful bytes in this package.
 2. Get the else 17 bytes data and send ACK after every byte
 3. Get the checksum and send NACK
 4. Stop condition
- D. Verify the checksum. if ok then the communication is ok
- E. Verify the received data from second byte; this byte is the status of the command just executed. If equal to the command (0x21) then the command execute successful. Then the 16 bytes data started from third byte are correct.

5 Description of commands

5.1 List of commands

| Command code | Command function |
|---------------------|--|
| 0x10 | Read product information |
| 0x11 | Module working mode set |
| 0x12 | Sets module idle |
| 0x15 | EEPROM read |
| 0x16 | EEPROM write |
| 0x17 | Set UART communication baud rate |
| 0x19 | Set IIC address |
| 0x1A | Set multi-card operation |
| 0x1C | Set automatic detecting card interval time |
| 0x20 | ISO14443A Request cards |
| 0x21 | Mifare 1K/4K data block read |
| 0x29 | Mifare 1K/4K sector (4 blocks) Read |
| 0x2A | Mifare 1K/4K multi blocks read |
| 0x22 | Mifare 1K/4K data block Write |
| 0x2B | Mifare 1K/4K multi blocks write |
| 0x23 | Mifare 1K/4K purse block initialize |
| 0x24 | Mifare 1K/4K purse read |
| 0x25 | Mifare 1K/4K purse increment |
| 0x26 | Mifare 1K/4K purse decrement |
| 0x27 | Mifare 1K/4K purse copy |
| 0x28 | ISO14443A card halt |
| 0x2D | Download Mifare 1K/4K card key to module |
| 0x30 | ISO14443-4 TYPE-A card reset |
| 0x31 | Send APDU to ISO14443-4 card |
| 0x41 | Ultra Light card read |
| 0x42 | Ultra Light card write |
| 0x70 | Set module card operating protocol |
| 0x60 | ISO14443-4 TYPE B card request |
| 0x62 | ISO14443-4 TYPE B card halt |
| 0x63 | SR serial cards 1 slot initiate card |
| 0x64 | SRI serial cards 16 slots initiate card |
| 0x65 | SR serial cards select |
| 0x66 | SRI serial cards return to inventory |
| 0x67 | SR serial cards completion |
| 0x68 | SR176 card read |
| 0x69 | SR176 card write |
| 0x6A | SR176 data block lock |

| | |
|------|----------------------------------|
| 0x6B | SRI serial cards read |
| 0x6C | SRI serial cards write |
| 0x6D | SRI serial cards lock block |
| 0x6E | SRI serial cards read UID |
| 0x6F | SRIX serial cards authentication |

5.2 Explanation of commands

5.2.1 Read product information

Function: read the product information of CURRENT PRODUCT, includes product name, firmware version, firmware date and configuration information.

Host sends:

| | | |
|------|------|----------|
| 0x02 | 0x10 | Checksum |
|------|------|----------|

Module returns success:

| | | | |
|------|------|-------------|----------|
| 0x1D | 0x10 | Information | Checksum |
|------|------|-------------|----------|

Information: 27 bytes, 8 bytes product name, 4 bytes firmware version, 8 bytes firmware date, 1 byte UART baud rate code, 1byte RFU, 1 byte IIC address, 1 byte multi-card operation enable state, 2 bytes RFU, 1 byte automatic detecting card interval (multiple of 10ms).

Module returns failure:

| | | |
|------|------|----------|
| 0x02 | 0xEF | Checksum |
|------|------|----------|

5.2.2 Module working mode set

Function: set the antenna RF output ON/OFF; set the automatic detecting card ON/OFF. Antenna RF output is default ON, and automatic detecting card is OFF. The module will NOT SAVE the setting, and all settings will LOSE on next power up. The multi-card operation will be prohibited while users turn ON the automatic detecting card. If there is more than one card in the RF electric field then the operation will fail.

Host sends:

| | | | |
|------|------|------|----------|
| 0x03 | 0x11 | Mode | Checksum |
|------|------|------|----------|

Mode: 1 byte

Antenna status: BIT0 = 0: OFF; BIT0 = 1: ON

Auto request: BIT1 = 0: OFF; BIT1 = 1: ON

Module returns success:

| | | |
|------|------|----------|
| 0x02 | 0x11 | Checksum |
|------|------|----------|

Module returns failure:

| | | |
|------|------|----------|
| 0x02 | 0xEE | Checksum |
|------|------|----------|

5.2.3 Set module idle

Function: set the module idle. In idle mode, the module of RF output turn to OFF, PCD power down, and CPU in idle mode, so the power consumption reduces to about 100uA. Sending the next command to module will wake up the module, and then the RF output ON and automatic detecting card restore default settings. The module will enter into idle mode after the answer procedure is finished. In IIC mode, host need to read the answer and then the module will goes into idle mode.

Host sends:

| | | | |
|------|------|-------------|----------|
| 0x03 | 0x12 | Random data | Checksum |
|------|------|-------------|----------|

Random data: 1 byte random data, for example: 0x55

Module returns success:

| | | |
|------|------|----------|
| 0x02 | 0x12 | Checksum |
|------|------|----------|

Module returns failure:

| | | |
|------|------|----------|
| 0x02 | 0xED | Checksum |
|------|------|----------|

5.2.4 EEPROM read

Function: read data in EEPROM of the module.

Host sends:

| | | | | |
|------|------|---------|-------|----------|
| 0x05 | 0x15 | Address | Bytes | Checksum |
|------|------|---------|-------|----------|

Address: 2 bytes, read start address, address from 0x0000 to 0x01FF, MSB first

Bytes: 1 byte, number of bytes to read, max. 64 bytes

Module returns success:

| | | | |
|---|------|------|----------|
| - | 0x15 | Data | Checksum |
|---|------|------|----------|

Remark: the byte length is “-“, means the byte length depends on the card feedback information. (the same to below)

Data: data read

Module returns failure:

| | | |
|------|------|----------|
| 0x02 | 0xEA | Checksum |
|------|------|----------|

5.2.5 EEPROM write

Function: write data into EEPROM of the module

Host sends:

| | | | | | |
|---|------|---------|-------|------|----------|
| - | 0x16 | Address | Bytes | Data | Checksum |
|---|------|---------|-------|------|----------|

Address: 2 bytes, read start address, address from 0x0000 to 0x01FF, MSB first

Bytes: 1 byte, number of bytes to read, max. 64 bytes

Data: "Bytes" data to write

Module returns success:

| | | |
|------|------|----------|
| 0x02 | 0x16 | Checksum |
|------|------|----------|

Module returns failure:

| | | |
|------|------|----------|
| 0x02 | 0xE9 | Checksum |
|------|------|----------|

5.2.6 Set UART communication baud rate

Function: set UART communication baud rate of the module. After module receive the command, it will first save the new setting, and then send the execute result according to the host. At last it will validate the new setting. UART communication baud rate is default 19200bps. Settings will SAVE in the module; it will not be lost after power OFF.

Host sends:

| | | | |
|------|------|-----------|----------|
| 0x03 | 0x17 | Baud rate | Checksum |
|------|------|-----------|----------|

Baud rate: 1 byte, baud rate code; 0: 19200bps; 1: 115200bps; other values: RFU

Module returns success:

| | | |
|------|------|----------|
| 0x02 | 0x17 | Checksum |
|------|------|----------|

Module returns failure:

| | | |
|------|------|----------|
| 0x02 | 0xE8 | Checksum |
|------|------|----------|

5.2.7 Set IIC communication address

Function: set IIC communication address of the module. After module receive the command, it will first save the new address, and then send the executed result to the host. At last it will validate the new settings. The IIC address of the module is 1 byte HEX data. Lsb is 0; the address of module must be the even number, and the invalid address will NOT be

accepted. Settings will save in the module, and it will be not lost after power OFF.

Host sends:

| | | | |
|------|------|---------|----------|
| 0x03 | 0x19 | Address | Checksum |
|------|------|---------|----------|

Address: 1 byte, Lsb is 0; address must be the even number

Module returns success:

| | | |
|------|------|----------|
| 0x02 | 0x19 | Checksum |
|------|------|----------|

Module returns failure:

| | | |
|------|------|----------|
| 0x02 | 0xE6 | Checksum |
|------|------|----------|

5.2.8 Set multi-card operation

Function: set multi-card operation. If users need select on card from multi-card, then need to use the multi-card operation. If users set the automatic detecting card, the multi-card operation will be prohibited. If there is more than one card in the RF effective field then the operation will fail. Settings will save in the module; it will be not lost after power OFF. Multi-card operation default enables. This function is suitable for ISO14443A only.

Host sends:

| | | | |
|------|------|-------------------|----------|
| 0x03 | 0x1A | Multi-card enable | Checksum |
|------|------|-------------------|----------|

Multi-card enable: 1 byte, 0: disable multi-card; 1: enable multi-card; other values: RFU

Module returns success:

| | | |
|------|------|----------|
| 0x02 | 0x1A | Checksum |
|------|------|----------|

Module returns failure:

| | | |
|------|------|----------|
| 0x02 | 0xE5 | Checksum |
|------|------|----------|

5.2.9 Set automatic detecting card interval time

Function: set interval time between two automatic detecting card

Host sends:

| | | | |
|------|------|---------------|----------|
| 0x03 | 0x1C | Interval Time | Checksum |
|------|------|---------------|----------|

Interval Time: 1 byte, 0x00 to 0xFF, unit is 10mS, 0x01 means 10mS.

Module returns success:

| | | |
|------|------|----------|
| 0x02 | 0x1C | Checksum |
|------|------|----------|

Module returns failure:

| | | |
|------|------|----------|
| 0x02 | 0xE3 | Checksum |
|------|------|----------|

5.2.10 ISO14443A request cards

Function: ISO14443A request cards, cards include Mifare and other ISO14443A cards. In the return results, user can ascertain the length of serial number via the return data package length, and also judge the card type by ATQA, and judge whether the card supports ISO14443-4 by SAK. If automatic detecting card function was turned on, then this command is read the result of automatic detecting card.

Host sends:

| | | | |
|------|------|------|----------|
| 0x03 | 0x20 | Mode | Checksum |
|------|------|------|----------|

Mode: 1 byte, 0: WUPA (request all); 1: REQA (Request not halted only); other value: RFU

Module returns success:

| | | | |
|---|------|------|----------|
| - | 0x20 | Data | Checksum |
|---|------|------|----------|

Data: 4, 7 or 10 bytes card serial number + 2 bytes ATQA + 1 byte SAK

Module returns failure:

| | | |
|------|------|----------|
| 0x02 | 0xDF | Checksum |
|------|------|----------|

5.2.11 Mifare 1K/4K data block read

Function: read Mifare 1K/4K data block

Host sends:

| | | | | | |
|------|------|--------|-------|-----|----------|
| 0x0A | 0x21 | Key ID | Block | Key | Checksum |
|------|------|--------|-------|-----|----------|

Key ID: 1 byte, Key identification

BIT0 = 0: Key A; BIT0 = 1: Key B;

BIT1 = 0: using the key in the command; BIT1 = 1: using the downloaded by command

0x2D

BIT6:BIT5:BIT4:BIT3:BIT2: if using the downloaded, then name the key number here.

(IMPORTANT: please read Chapter 5.3 about Key identification)

Block: 1 byte, Block number to read, 0 to 0x3F for S50; 0 to 0xFF for S70

Key: 6 bytes, the key of the card

Module returns success:

| | | | |
|------|------|------|----------|
| 0x12 | 0x21 | Data | Checksum |
|------|------|------|----------|

Data: 16 bytes card data

Module returns failure:

| | | |
|------|------|----------|
| 0x02 | 0xDE | Checksum |
|------|------|----------|

5.2.12 Mifare 1K/4K sector (4 blocks) read

Function: read Mifare 1K/4K sector (4 blocks). For S50 and sector number less than 32 of S70, this command is called read sector, it will read the sector trailer. For sector 32 to 39 of S70, this command is called “read 4 blocks”. Because the sectors are include 16 blocks, and then module will read 4 blocks. If you need to read the 16 blocks in these sectors, you need do this command 4 times to fill the requirements. The “Sector” in package is: read start block number shift right 2 bits.

Host sends:

| | | | | | |
|------|------|--------|--------|-----|----------|
| 0x0A | 0x29 | Key ID | Sector | Key | Checksum |
|------|------|--------|--------|-----|----------|

Key ID: 1 byte, Key identification

Sector: 1 byte, Sector number to read, 0 to 0x0F for S50; 0 to 0x3F for S70

Key: 6 bytes, the key of the card

Module returns success:

| | | | |
|------|------|------|----------|
| 0x42 | 0x29 | Data | Checksum |
|------|------|------|----------|

Data: 64 bytes card data

Module returns failure:

| | | |
|------|------|----------|
| 0x02 | 0xD6 | Checksum |
|------|------|----------|

5.2.13 Mifare 1K/4K multi blocks read

Function: read multi data blocks in the same sector. The function is supported only in the same sector. If cross sectors, then read will fail.

Host sends:

| | | | | | | |
|------|------|--------|-------------|--------|-----|----------|
| 0x0A | 0x2A | Key ID | Start Block | Blocks | Key | Checksum |
|------|------|--------|-------------|--------|-----|----------|

Key ID: 1 byte, key identification

Start Block: 1 byte, start block to read

Blocks: 1 byte, number of block to read

Key: 6 bytes, the key of the card

Module returns success:

| | | | |
|---|------|------|----------|
| - | 0x2A | Data | Checksum |
|---|------|------|----------|

Data: (blocks)*(16 bytes card data)

Module returns failure:

| | | |
|------|------|----------|
| 0x02 | 0xD5 | Checksum |
|------|------|----------|

5.2.14 Mifare 1K/4K data block write

Function: write the data to a block of Mifare 1K/4K.

Host sends:

| | | | | | | |
|------|------|--------|-------|-----|------|----------|
| 0x1A | 0x22 | Key ID | Block | Key | Data | Checksum |
|------|------|--------|-------|-----|------|----------|

Key ID: 1 byte, Key identification

Block: 1 byte, Block number to write, 0 to 0x3F for S50; 0 to 0xFF for S70

Key: 6 bytes, the key of the card

Data: 16 bytes data to write

Module returns success:

| | | |
|------|------|----------|
| 0x02 | 0x22 | Checksum |
|------|------|----------|

Module returns failure:

| | | |
|------|------|----------|
| 0x02 | 0xDD | Checksum |
|------|------|----------|

5.2.15 Mifare 1K/4K multi blocks write

Function: write multi data blocks. The function is supported only in the same sector. If cross sector, it will fail while writing first block and then prompt the error in the returned result.

Host sends:

| | | | | | | | |
|------|------|--------|-------------|--------|-----|------|----------|
| 0x0A | 0x2B | Key ID | Start Block | Blocks | Key | Data | Checksum |
|------|------|--------|-------------|--------|-----|------|----------|

Key ID: 1 byte, key identification

Start Block: 1 byte, the start block to write

Blocks: 1 byte, number of block to write

Key: 6 bytes, the key of the card

Data: (blocks)*(16 bytes data to write)

Module returns success:

| | | |
|------|------|----------|
| 0x42 | 0x2B | Checksum |
|------|------|----------|

Module returns failure:

| | | |
|------|------|----------|
| 0x02 | 0xD4 | Checksum |
|------|------|----------|

5.2.16 Mifare 1K/4K purse block initialize

Function: initialize a block of Mifare 1K/4K to a purse. The format of purse uses Mifare 1K/4K's default. The key of the card could not use as a purse.

Host sends:

| | | | | | | |
|------|------|--------|-------|-----|-------|----------|
| 0x0E | 0x23 | Key ID | Block | Key | Value | Checksum |
|------|------|--------|-------|-----|-------|----------|

Key ID: 1 byte, Key identification

Block: 1 byte, Block number to initialize, 0 to 0x3F for S50; 0 to 0xFF for S70

Key: 6 bytes, the key of the card

Value: 4 bytes, initialized value, LSB first

Module returns success:

| | | |
|------|------|----------|
| 0x02 | 0x23 | Checksum |
|------|------|----------|

Module returns failure:

| | | |
|------|------|----------|
| 0x02 | 0xDC | Checksum |
|------|------|----------|

5.2.17 Mifare 1K/4K purse read

Function: read a purse of Mifare 1K/4K. The format of the purse uses Mifare 1K/4K's default. Module will read the data in the block and check if it is a purse format. If yes, return 4 bytes value data, if no, return failure.

Host sends:

| | | | | | |
|------|------|--------|-------|-----|----------|
| 0x0A | 0x24 | Key ID | Block | Key | Checksum |
|------|------|--------|-------|-----|----------|

Key ID: 1 byte, Key identification

Block: 1 byte, block number of the value to read, 0 to 0x3F for S50; 0 to 0xFF for S70

Key: 6 bytes, the key of the card

**Module returns success:**

| | | | |
|------|------|------|----------|
| 0x06 | 0x24 | Data | Checksum |
|------|------|------|----------|

Data: 4 bytes value data, LSB first

Module returns failure:

| | | |
|------|------|----------|
| 0x02 | 0xDB | Checksum |
|------|------|----------|

5.2.18 Mifare 1K/4K purse increment

Function: purse increment of Mifare 1K/4K. The format of the purse uses Mifare1K/4K's default. Purse increment means the increment on the basis of the original number.

Host sends:

| | | | | | | |
|------|------|--------|-------|-----|-------|----------|
| 0x0E | 0x25 | Key ID | Block | Key | Value | Checksum |
|------|------|--------|-------|-----|-------|----------|

Key ID: 1 byte, Key identification

Block: 1 byte, block number to initialize, 0 to 0x3F for S50; 0 to 0xFF for S70

Key: 6 bytes, the key of the card

Value: 4 bytes, increment value, LSB first

Module returns success:

| | | |
|------|------|----------|
| 0x02 | 0x25 | Checksum |
|------|------|----------|

Module returns failure:

| | | |
|------|------|----------|
| 0x02 | 0xDA | Checksum |
|------|------|----------|

5.2.19 Mifare 1K/4K purse decrement

Function: purse decrement of Mifare 1K/4K. The format of the purse uses Mifare 1K/4K's default. Purse decrement means the decrement on the basis of the original number. Purse decrement only needs the read authority of the key.

Host sends:

| | | | | | | |
|------|------|--------|-------|-----|-------|----------|
| 0x0E | 0x26 | Key ID | Block | Key | Value | Checksum |
|------|------|--------|-------|-----|-------|----------|

Key ID: 1 byte, Key identification

Block: 1 byte, Block number to initialize, 0 to 0x3F for S50; 0 to 0xFF for S70

Key: 6 bytes, the key of the card

Value: 4 bytes, increment value, LSB first

**Module returns success:**

| | | |
|------|------|----------|
| 0x02 | 0x26 | Checksum |
|------|------|----------|

Module returns failure:

| | | |
|------|------|----------|
| 0x02 | 0xD9 | Checksum |
|------|------|----------|

5.2.20 Mifare 1K/4K purse copy

Function: copy the Mifare 1K/4K purse to another block in the same sector. The format of the purse uses Mifare 1K/4K's default.

Host sends:

| | | | | | | |
|------|------|--------|--------|--------|-----|----------|
| 0x0B | 0x27 | Key ID | Source | Target | Key | Checksum |
|------|------|--------|--------|--------|-----|----------|

Key ID: 1 byte, Key identification

Source: 1 byte, block number to copy, 0 to 0x3F for S50; 0 to 0xFF for S70

Target: 1 byte, copy the purse to this block (source and target need in same sector)

Key: 6 bytes, the key of the card

Module returns success:

| | | |
|------|------|----------|
| 0x02 | 0x27 | Checksum |
|------|------|----------|

Module returns failure:

| | | |
|------|------|----------|
| 0x02 | 0xD8 | Checksum |
|------|------|----------|

5.2.21 ISO14443A card halt

Function: set the current operating ISO14443A card in halt state.

Host sends:

| | | |
|------|------|----------|
| 0x02 | 0x28 | Checksum |
|------|------|----------|

Module returns success:

| | | |
|------|------|----------|
| 0x02 | 0x28 | Checksum |
|------|------|----------|

Module returns failure:

| | | |
|------|------|----------|
| 0x02 | 0xD7 | Checksum |
|------|------|----------|

5.2.22 Download Mifare 1K/4K card key to module

Function: download the Mifare 1K/4K card key to module. There are 32 key memory spaces in the module that can storage 32 different keys. When using the downloaded key on

the module, this key wouldn't appear on the pin-outs of the PCD. So it could provide more security.

Host sends:

| | | | | |
|------|------|-----------|-----|----------|
| 0x09 | 0x2D | Key Index | Key | Checksum |
|------|------|-----------|-----|----------|

Key Index: 1 byte, store the Key Index in the module

Key: 6 bytes, the key of the card to store in module

Module returns success:

| | | |
|------|------|----------|
| 0x02 | 0x2D | Checksum |
|------|------|----------|

Module returns failure:

| | | |
|------|------|----------|
| 0x02 | 0xD2 | Checksum |
|------|------|----------|

5.2.23 ISO14443-4 TYPE-A card reset

Function: reset an ISO14443-4 TYPE-A card. Before executing this command, it needs to request card and verifies the card support ISO14443-4 in the SAK of card. If operate ISO14443-4 card, then need to turn OFF the automatic detecting card. That's because the ISO14443-4 card state will be lost in the automatic detecting card.

Host sends:

| | | |
|------|------|----------|
| 0x02 | 0x30 | Checksum |
|------|------|----------|

Module returns success:

| | | | |
|---|------|------|----------|
| - | 0x30 | Info | Checksum |
|---|------|------|----------|

Info: card reset information, length depends on card

Module returns failure:

| | | |
|------|------|----------|
| 0x02 | 0xCF | Checksum |
|------|------|----------|

5.2.24 Send APDU to ISO14443-4 card

Function: send APDU to an ISO14443-4 card. Before executing the command, it needs to reset the card. If operate ISO14443-4 card, then need to turn OFF the automatic detecting card. That's because the ISO14443-4 card's state will be lost in automatic detecting card.

Host sends:

| | | | |
|---|------|------|----------|
| - | 0x31 | APDU | Checksum |
|---|------|------|----------|

APDU: APDU to send

**Module returns success:**

| | | | |
|---|------|----------|----------|
| - | 0x31 | Response | Checksum |
|---|------|----------|----------|

Response: card answers, length depends on the detailed command

Module returns failure:

| | | |
|------|------|----------|
| 0x02 | 0xCE | Checksum |
|------|------|----------|

5.2.25 Ultra Light card read

Function: read the data from Ultra Light card. A read command will read 4 blocks data from the card. If read start block is the last block, then these 4 blocks data are the 15th, 0th, 1st and 2nd block.

Host sends:

| | | | |
|------|------|------------------|----------|
| 0x05 | 0x41 | Read start block | Checksum |
|------|------|------------------|----------|

Read start block: 1 byte, start block number to read

Module returns success:

| | | | |
|------|------|------|----------|
| 0x12 | 0x41 | Data | Checksum |
|------|------|------|----------|

Data: 16 bytes card data of 4 blocks, a read operation read 4 blocks from the start block.

Module returns failure:

| | | |
|------|------|----------|
| 0x02 | 0xBE | Checksum |
|------|------|----------|

5.2.26 Ultra Light card write

Function: write data to Ultra Light card.

Host sends:

| | | | | |
|------|------|-------|------|----------|
| 0x05 | 0x42 | Block | Data | Checksum |
|------|------|-------|------|----------|

Block: 1 byte, block number to write

Data: 4 bytes data to write

Module returns success:

| | | |
|------|------|----------|
| 0x12 | 0x42 | Checksum |
|------|------|----------|

Module returns failure:

| | | |
|------|------|----------|
| 0x02 | 0xBD | Checksum |
|------|------|----------|

5.2.27 Set module card operating protocol

Function: set module card operating protocol, default is ISO14443A. The setting will not be saved and will return to the default state at next power up.

Host sends:

| | | | |
|------|------|-------|----------|
| 0x03 | 0x70 | Model | Checksum |
|------|------|-------|----------|

Model: 1 byte, 0: ISO14443A; 1: ISO14443B; 2: ISO15693; other value: RFU

Module returns success:

| | | |
|------|------|----------|
| 0x12 | 0x70 | Checksum |
|------|------|----------|

Module returns failure:

| | | |
|------|------|----------|
| 0x02 | 0x8F | Checksum |
|------|------|----------|

5.2.28 ISO14443-4 TYPE B card request

Function: ISO14443-4 TYPE B card request and set the communication parameters. The reader will skip the remains operation after one card answer successful.

Host sends:

| | | | | | |
|------|------|-------|-----|------|----------|
| 0x05 | 0x60 | Model | AFI | SLOT | Checksum |
|------|------|-------|-----|------|----------|

Model: 1 byte, 0: WUPB (Wakeup B); 1: REQB (Request B); other values: RFU

AFI: 1 byte, the AFI to request, if request all AFI, please use 0x00

SLOT: 1 byte, slot numbers for request; uses 1, 2, 4, 8, 16, all other value are RFU

Module returns success:

| | | | |
|------|------|------|----------|
| 0x0E | 0x60 | Info | Checksum |
|------|------|------|----------|

Info: 12 bytes, card reset information

Module returns failure:

| | | |
|------|------|----------|
| 0x02 | 0x9F | Checksum |
|------|------|----------|

5.2.29 ISO14443-4 TYPE B card halt

Function: set the current ISO14443B card halt.

Host sends:

| | | | |
|------|------|------|----------|
| 0x03 | 0x62 | PUPI | Checksum |
|------|------|------|----------|

PUPI: 4 bytes, PUPI of the card to halt

**Module returns success:**

| | | |
|------|------|----------|
| 0x02 | 0x62 | Checksum |
|------|------|----------|

Module returns failure:

| | | |
|------|------|----------|
| 0x02 | 0x9D | Checksum |
|------|------|----------|

5.2.30 SR serial cards 1 slot initiate card

Function: SR serial cards (SR176/SRI512/SRI1K/SRI2K/SRI4K/SRIX4K, the same below) single channel initiate card. Before read/write card, it needs to use the command of “SR serial cards select” to select the card. More detailed card operations see the card manual please.

Host sends:

| | | |
|------|------|----------|
| 0x06 | 0x63 | Checksum |
|------|------|----------|

Module returns success:

| | | | |
|------|------|---------|----------|
| 0x03 | 0x63 | Card ID | Checksum |
|------|------|---------|----------|

Card ID: 1 byte, card ID

Module returns failure:

| | | |
|------|------|----------|
| 0x02 | 0x9C | Checksum |
|------|------|----------|

5.2.31 SRI serial cards 16 slots initiate card

Function: SRI serial cards 16 slots initiate card.

Host sends:

| | | |
|------|------|----------|
| 0x02 | 0x64 | Checksum |
|------|------|----------|

Module returns success:

| | | | | |
|------|------|--------|---------|----------|
| 0x22 | 0x64 | Status | Card ID | Checksum |
|------|------|--------|---------|----------|

Status: 16 bytes, the initiate result of 16 channels, 0x00: current channel success; 0xE8: current channel collision; 0xFF: current channel no card

Card ID: 16 bytes; card ID of 16 channels; it is valid while the status of current channel is successful

Module returns failure:

| | | |
|------|------|----------|
| 0x02 | 0x9B | Checksum |
|------|------|----------|

5.2.32 SR serial cards select

Function: select a SR card as the CURRENT CARD. You could operate the card after select.

Host sends:

| | | | |
|------|------|---------|----------|
| 0x03 | 0x65 | Card ID | Checksum |
|------|------|---------|----------|

Card ID: 1 byte; Card ID to select

Module returns success:

| | | | |
|------|------|---------|----------|
| 0x03 | 0x65 | Card ID | Checksum |
|------|------|---------|----------|

Card ID: 1 byte; the selected card ID

Module returns failure:

| | | |
|------|------|----------|
| 0x02 | 0x9A | Checksum |
|------|------|----------|

5.2.33 SRI serial cards return to inventory

Function: set a selected SRI card returning to inventory state.

Host sends:

| | | |
|------|------|----------|
| 0x02 | 0x66 | Checksum |
|------|------|----------|

Module returns success:

| | | |
|------|------|----------|
| 0x02 | 0x66 | Checksum |
|------|------|----------|

Module returns failure:

| | | |
|------|------|----------|
| 0x02 | 0x99 | Checksum |
|------|------|----------|

5.2.34 SR serial cards completion

Function: set the CURRENT CARD into the completion state. If want to operate the card again, then need to move the card out of the antenna RF effective field and initiate the card.

Host sends:

| | | |
|------|------|----------|
| 0x02 | 0x67 | Checksum |
|------|------|----------|

Module returns success:

| | | |
|------|------|----------|
| 0x02 | 0x67 | Checksum |
|------|------|----------|

Module returns failure:

| | | |
|------|------|----------|
| 0x02 | 0x98 | Checksum |
|------|------|----------|

5.2.35 SR176 card read

Function: read SR176 card data block.

Host sends:

| | | | |
|------|------|-------|----------|
| 0x06 | 0x68 | Block | Checksum |
|------|------|-------|----------|

Block: 1 byte, data block number to read

Module returns success:

| | | | |
|------|------|------|----------|
| 0x04 | 0x68 | Data | Checksum |
|------|------|------|----------|

Data: 2 bytes, data read

Module returns failure:

| | | |
|------|------|----------|
| 0x02 | 0x97 | Checksum |
|------|------|----------|

5.2.36 SR176 card write

Function: write the data block of SR176 card. After write, module will read the data and compare. If not equal, then return failure.

Host sends:

| | | | | |
|------|------|-------|------|----------|
| 0x05 | 0x69 | Block | Data | Checksum |
|------|------|-------|------|----------|

Block: 1 byte, data block number to read

Data: 2 bytes, data to write

Module returns success:

| | | |
|------|------|----------|
| 0x02 | 0x69 | Checksum |
|------|------|----------|

Module returns failure:

| | | |
|------|------|----------|
| 0x02 | 0x96 | Checksum |
|------|------|----------|

5.2.37 SR176 data block lock

Function: write the data of SR176 lock register of the card. The module will check the lock result after write.

Host sends:

| | | | |
|------|------|------------|----------|
| 0x03 | 0x6A | Lock value | Checksum |
|------|------|------------|----------|

Locked value: 1 byte; the lock register values to write

Module returns success:

| | | |
|------|------|----------|
| 0x02 | 0x6A | Checksum |
|------|------|----------|

Module returns failure:

| | | |
|------|------|----------|
| 0x02 | 0x95 | Checksum |
|------|------|----------|

5.2.38 SRI serial cards read

Function: read data block of SRI serial card

Host sends:

| | | | |
|------|------|-------|----------|
| 0x03 | 0x6B | Block | Checksum |
|------|------|-------|----------|

Block: 1 byte; data block number to read

Module returns success:

| | | | |
|------|------|------|----------|
| 0x06 | 0x6B | Data | Checksum |
|------|------|------|----------|

Data: 4 bytes, data read

Module returns failure:

| | | |
|------|------|----------|
| 0x02 | 0x94 | Checksum |
|------|------|----------|

5.2.39 SRI serial cards write

Function: write data block of SRI serial card. After write, module will read data and compare. If not equal, then return failure.

Host sends:

| | | | | |
|------|------|-------|------|----------|
| 0x07 | 0x6C | Block | Data | Checksum |
|------|------|-------|------|----------|

Block: 1 byte; data block number to read

Data: 4 bytes; data to write

Module returns success:

| | | |
|------|------|----------|
| 0x02 | 0x6C | Checksum |
|------|------|----------|

Module returns failure:

| | | |
|------|------|----------|
| 0x02 | 0x93 | Checksum |
|------|------|----------|

5.2.40 SRI serial cards data block lock

Function: write the data of SRI card to lock the register. It will check the locked result after write.

Host sends:

| | | | |
|------|------|--------------|----------|
| 0x03 | 0x6D | Locked value | Checksum |
|------|------|--------------|----------|

Locked value: 1 byte; the locked register values to write

Module returns success:

| | | |
|------|------|----------|
| 0x02 | 0x6D | Checksum |
|------|------|----------|

Module returns failure:

| | | |
|------|------|----------|
| 0x02 | 0x92 | Checksum |
|------|------|----------|

5.2.41 SRI serial cards read UID

Function: SRI serial cards read UID

Host sends:

| | | |
|------|------|----------|
| 0x02 | 0x6E | Checksum |
|------|------|----------|

Module returns success:

| | | | |
|------|------|-----|----------|
| 0x0A | 0x6E | UID | Checksum |
|------|------|-----|----------|

UID: 8 bytes, UID of CURRENT CARD

Module returns failure:

| | | |
|------|------|----------|
| 0x02 | 0x91 | Checksum |
|------|------|----------|

5.2.42 SRIX serial cards authentication

Function: SRIX serial card authentication; Anti clone function of the SRIX serial card.

Host sends:

| | | | |
|------|------|------|----------|
| 0x06 | 0x6F | Data | Checksum |
|------|------|------|----------|

Data: 6 bytes, data input

Module returns success:

| | | | |
|------|------|--------|----------|
| 0x05 | 0x6F | Result | Checksum |
|------|------|--------|----------|

Result: 3 bytes, result return

Module returns failure:

| | | |
|------|------|----------|
| 0x02 | 0x90 | Checksum |
|------|------|----------|

5.3 About KEY Identification

There is a byte of KEY identification in command of Mifare 1K/4K read/write. This byte will identify the way to get the card key.

| Key Identification | | | | | | | |
|--------------------|------|------|------|------|------|------|------|
| BIT7 | BIT6 | BIT5 | BIT4 | BIT3 | BIT2 | BIT1 | BIT0 |
| 0 | | | | | | | |

BIT0 0: KEY A; authenticate Key A of the card.

1: KEY B; authenticate Key B of the card.

BIT1 0: Using the following Key in command.

1: Using the downloaded Key by command 0x2D.

BIT6:BIT5:BIT4:BIT3:BIT2: Index of the Key already downloaded (0 to 31).

If BIT1 is 0, then these 5 bits (BIT6 to BIT2) are unused. If BIT1 is 1, then use the already downloaded key. Users need to download key(s) by using command 0x2D first; and then the 6 bytes key in the command are left unused, but the 6-byte is necessary in the command sequence.

E.g.: key Identification is 0x30; binary system is 00000000, here:

BIT0 = 0; authenticate Key A of the card

BIT1 = 0; using the key in command

BIT6:BIT5:BIT4:BIT3:BIT2: 00000, because not use the already downloaded key, the index key is unused in this command.

E.g.: key Identification is 0x33; binary system is 00110011, here:

BIT0 = 1; authenticate Key B of the card

BIT1 = 1; using the downloaded Key in the module

BIT6:BIT5:BIT4:BIT3:BIT2:01100, then use the already downloaded key 01100, and hexadecimal is 0x0C, decimal is 12.

5.4 About automatic detecting card

The automatic detecting card function supports ISO14443A. It is default OFF. User could set the automatic detecting card on by send command 0x11. This setting will lose on next power up.

Automatic detecting card supports full function of Mifare 1K/4K and Ultra Light.

Automatic detecting card can find ISO14443A smart cards. If user needs to send APDU to the card, then must turn automatic detecting card OFF for correct operation.

Automatic detecting card supports only one card operation. If there is more than one card in the RF effective field then the operation may fail. Then the multi-card operation will automatically turn OFF while the automatic detecting card function turned on.

5.5 Example of commands

5.5.1 About UART communication protocol

For example:

Read block 1: AABB 0A210001AA00BBCCDDEEFF2A

AABB: Header of UART protocol, IIC protocol no this part

0A: package length; from 0A to FF are total 0x0A bytes, the 00 in red is a protocol byte, see

chapter 4.2.2

21: instruction of read

00: Authenticate KEY A, using the key in package. The key is “AABBCCDDEEFF”

01: block number to read

AABBCCDDEEFF: key of the sector of the card

00: protocol byte, used to distinguish header. See chapter 3.1.2

2A: $0A \wedge 21 \wedge 00 \wedge 01 \wedge AA \wedge BB \wedge CC \wedge DD \wedge EE \wedge FF = 2A$, in sample program, the function will calculate it, see chapter 4.5

5.5.2 UART commands sample

Read block 1 AABB 0A210001FFFFFFFFFFFFFF2A
Read block 255 (S70) AABB 0A2100FFFFFFFFFFFFFFD4
Write block 1 AABB 1A220001FFFFFFFFFFFFFF1234567890ABCDEF1234567890ABCDEF39
Request card (WUPA) AABB 03200023
Halt card AABB 021210

5.5.3 IIC commands sample

Read block 1 0A210001FFFFFFFFFFFFFF2A
Read block 255 (S70) 0A2100FFFFFFFFFFFFFFD4
Write block 1 1A220001FFFFFFFFFFFFFF1234567890ABCDEF1234567890ABCDEF39
Request card (WUPA) 03200023
Halt card 021210

5.6 Interface program source code

We have interface program source code to help users. They are KELL project in C51 or ASM51 format. Please mail to jinmuyu@vip.sina.com to obtain the program.
